

# Average Spectra

Average spectra.

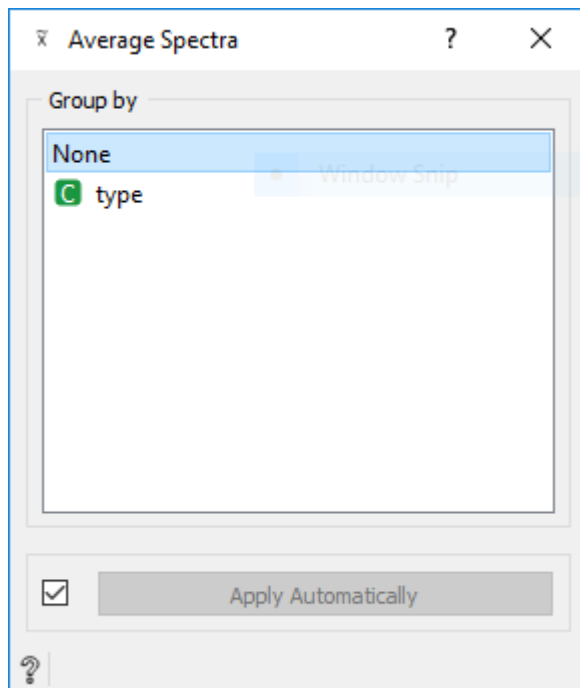

## Inputs

- Data: input dataset

## Outputs

- Averages: averaged dataset

The **Average Spectra** widget enables you to calculate average spectra. It can output the average of the entire dataset, or average into groups defined by a Categorical feature.

Use *Group by* to output averages defined by a Categorical feature.

Columns of non-Numerical data will return a value if every row in that group has the same value, otherwise it will return Unknown.
